

Knowledge Brokering

Bridging the gap between climate science and decision-makers

The Climate Systems Hub is an applied science partnership of Australia's leading climate and adaptation experts and climate change research and decision-making agencies. Through a partnership with the Cross-Jurisdictional Community of Practice for Climate Science we built a network of knowledge brokers across Australia's states and territories. Together we are delivering climate science and adaptation research that better meets the needs of our stakeholders.

Interjurisdictional knowledge brokering team

Stakeholders are demanding nationally comparable and robust, decision-ready information about climate change. This has caused an important shift towards government collaboration, through the Cross-Jurisdictional Community of Practice for Climate Science (CJ COP CS). The CJ COP CS was established by state, territory and the Australian governments in 2019 to enable all jurisdictions to collaborate and participate in better meeting the needs of climate science users.

The success of this collaboration has delivered the first-ever interjurisdictional climate change knowledge brokering team. The Climate Systems Hub's network of knowledge brokers across states and territories is strengthening the impact of the hub by driving engagement with research users. This engagement is helping shape future research, ensuring it is inclusive of state and territory perspectives and building a national picture of end-user requirements.

The Climate Systems Hub is funded by the Australian Government under the National Environmental Science Program, with co-investment from the following partners:

About the NESP Climate Systems Hub

The Climate Systems Hub is one of 4 multi-disciplinary research hubs within the Australian Government's National Environmental Science Program (NESP). The hub is an applied science partnership including Australia's leading climate change research and decision-making agencies.

How can knowledge brokers help you?

Knowledge brokers act as interpreters between climate scientists and decision-makers. They build partnerships to ensure research is co-designed and co-produced with the people that need it to inform their decisions.

The hub knowledge brokers can assist anyone from any state or territory to understand how potential changes to our future climate may impact their organisation, business or sector. We can work with you to identify knowledge gaps and to ensure your needs inform some of Australia's leading climate research. This ensures climate science products and services are fit-for-purpose and support your organisation to consider the latest science in your policies, planning and decisions to build a more climate-resilient Australia.
